

Package `fr.rphstudio.codingdojo.game.functions.checkpoints`

Interface **GenericCheckpointFunctions**

public interface **GenericCheckpointFunctions**

**Author:**  
Romuald GRIGNON

**Method Summary**

All Methods	Instance Methods	Abstract Methods
Modifier and Type	Method	Description
float	<code>getCheckpointPositionX(int checkPointIndex)</code>	Gets the X-axis position of a specific checkpoint.
float	<code>getCheckpointPositionY(int checkPointIndex)</code>	Gets the Y-axis position of a specific checkpoint.
boolean	<code>isCheckpointCharging(int checkPointIndex)</code>	Gets information about the charging ability of a specific checkpoint.

**Method Detail**

**getCheckpointPositionX**

```
float getCheckpointPositionX(int checkPointIndex)
```

Gets the X-axis position of a specific checkpoint. The index of the specific checkpoint is given in parameter. This function is useable with any code level.

**Parameters:**  
checkPointIndex - integer value for the checkpoint index (from 0 to N-1 (both included), with N the number of checkpoints returned by `MainFunctions.getNbRaceCheckPoints()`).

**Returns:**  
a floating value for X-axis position of the requested checkpoint.

**getCheckpointPositionY**

```
float getCheckpointPositionY(int checkPointIndex)
```

Gets the Y-axis position of a specific checkpoint. The index of the specific checkpoint is given in parameter. This function is useable with any code level.

**Parameters:**

checkpointIndex - integer value for the checkpoint index (from 0 to N-1 (both included), with N the number of checkpoints returned by `MainFunctions.getNbRaceCheckPoints()`).

**Returns:**

a floating value for Y-axis position of the requested checkpoint.

**isCheckpointCharging**

```
boolean isCheckpointCharging(int checkpointIndex)
```

Gets information about the charging ability of a specific checkpoint. The index of the specific checkpoint is given in parameter. This function is useable with any code level.

**Parameters:**

checkpointIndex - integer value for the checkpoint index (from 0 to N-1 (both included), with N the number of checkpoints returned by `MainFunctions.getNbRaceCheckPoints()`).

**Returns:**

a boolean value to indicate if the requested checkpoint is a charge area (true) or not (false).
